App Discovery at SaaS Speed.

Apps multiply, update, and connect faster than you can track—security can't keep up. The average enterprise uses over 2,500 apps, with 2-3 new apps and five new AI tools connecting weekly. This is App Sprawl in action—and it's widening the SaaS Security Gap. With Dynamic SaaS Security by Reco, sprawl is visible, containable, and manageable.

Expose Every Connected App

Instantly uncover your entire app ecosystem: sanctioned applications, shadow SaaS, SaaS-to-SaaS connections, AI agents, and the GenAI tools your Marketing team installed last week. App connections can be a security backdoor—Reco slams it shut.

Track App-to-App Connections

Map the invisible web of connections between your critical SaaS platforms. Identify exactly which third-party apps have their hooks in your Salesforce, Google Workspace, or Microsoft 365.

Identify Misconfigured & Over-Permissive Apps

Ensure SaaS apps are properly configured with the right level of data access and never deviate from business intent. Reco measures risk from unused connected apps that still retain access to SaaS data. Flag apps with excessive access privileges.

Prioritize with AI-Based Context

Rely on advanced analytics based on a combination of algorithms, models, processes and tools to help you prioritize the riskiest apps. Use this intelligence to remove unused or unsanctioned apps.

+2500

unique apps discovered in organizations with 1500+ employees

2-3

new apps integrated weekly through App Factory™

~5

~5 new AI SaaS apps connecting to your core platforms weekly

Secure Every SaaS App

Reco secures 150+ apps

big·id

That's a huge differentiator compared to the rest of the players in the space. And because most of the time when you ask for integrations, they'll say we'll add it to our roadmap, maybe next year, whereas Reco is very adaptable. They're very agile.

Kyle Kurdziolek

Head of Security & Compliance

belk

When we talk about applications that we manage, we manage about 200. Well, you add all these SaaS applications that are on our network — that's more like a thousand now. Their factory model of getting connectivity to other core applications is phenomenal.
